

### Assessing Student Progress

The best way to determine if a student may need intervention or may be ready to move to the next product is to consult the completion status flags within Progress Tracker. However, it is sometimes appropriate to use these Progress Guidelines to fine tune the motivation and intervention strategies you use with your students. The tables in this document can help you determine what course of action, if any, to take with a student. Students should be evaluated at least every five participation days. Use the Progress Tracker Participation report to determine a student's total minutes worked, then use the tables in this document to determine the student's completion status.

#### USING THE TABLES

- 1) To determine a student's status in the product, locate the *Minutes Worked* range for each exercise in the tables below and note the corresponding percent complete scores. A student may have a different number of minutes worked for each exercise. In this case, use the appropriate minutes range to evaluate each exercise separately.
- 2) To determine the recommended course of action, use these guidelines.
  - **May Need Intervention:** Any exercise can be assessed individually; the student may need intervention if any of the student's current percent complete values are below the values in the *May Need to Intervene* chart, which will also trigger an *Intervene* flag in Progress Tracker.
  - **At Switch Levels:** The student may be ready to move to the next appropriate product, if applicable, if **ALL** of the exercises meet the percent complete values for **ALL** criteria in the *Switch* chart.
  - **At Completion Levels:** The student may be ready to stop using the product or move to the next appropriate product if his/her percent complete values for **ALL** of the exercises are at least as high as those in the *Complete* chart.

When evaluating a student's progress, keep in mind that each student will progress at his/her own rate through the exercises. *If a student is benefiting from the product regardless of his/her rate of completion, he/she should always continue working on that product.* Younger children or children with language difficulties usually complete Fast ForWord products more slowly than older children or children without language difficulties. For example, in general, a 9-year old student will progress on a product more slowly than a 13-year old student.

If you have further questions about a student's progress, contact Scientific Learning's Instructional Support at 888-358-0212.
